

# WINTER ASTRONOMY NIGHTS

February 20 | 7:30PM

## **Moonless & Mars**

Come observe Mars, as it will be as close as it will be for the next two years. This is also a moonless night, the darkness will allow us to observe some wintertime objects like the Orion nebula.

March 3 | 7:10PM

## **Elusive Mercury**

The thin crescent Moon will be visible, which will make craters and Earthshine easy to observe. Mercury and Venus will be well-placed for observation. This is one of the rare opportunities to see the elusive Mercury near its best.

**Come join local Astronomer Jeff Massura as he presents a spectacular 45 minute program.**

**Program will be held OUTSIDE at Voigt Park  
(Parking Lot: 203 W. South St, Monticello)**

**\*\*Dress for the Weather\*\***
